## *Research Q*

Why were countries that signed more trade liberalization agreements before the outbreak of COVID-19 pandemic less effective to prevent and control its spread?

## *Background & Basic Facts*

- The COVID-19 pandemic challenges the conventional view linking economic downturns with infectious diseases.
- However, the high degree of globalization in contemporary human society, infectious diseases now spread faster and over a wider geographical range than in the past (Fidler, 2003; Kimball, 2006).

- there is indeed a correlation between a country's level of economic development and the quality of its public health; however the existing literature in the field of PH overlook the impact of “external factors”.

## **Wildlife Trade, COVID-19, and Other Zoonotic Diseases**

## *IT: An External Factor*

- The existing literature has notably focused on the negative impacts caused by *G*
- *G* has had ‘negative effects’ on ‘certain countries,’ for instance, in international investment where the invested countries have experienced a decline in environmental quality.

- 
- The background of the slide features a faint, light blue image of classical architectural columns, possibly from a government building or a university, set against a light blue gradient. The columns are fluted and have ornate capitals.
- Why are certain countries? Are all highly globalized countries experiencing severe domestic outbreaks? Have we overlooked something in the context of globalization?
  - This paper questions the conventional wisdom of singling out specific countries for certain conditions and suggests a need to consider other factors, e.g.: *the legal obligations that a country assumes after signing a trade liberalization agreement.*

## *Research Design*

- The scope covers the period from the end of January 2020 to the end of November 2021.
- Two hypotheses:
  - (H1) when a country assumes more obligations related to TL, its epidemic prevention performance tends to be worse.
  - (H2) the obligations of TL that a country assumes
    - have a more critical impact on epidemic prevention performance compared to its level of trade openness.

## *Preliminary Research Findings*

- The higher the degree of TL obligation a country undertakes, the less effective it is in preventing and controlling the spread of COVID-19 within its borders.
- There exists a substitute relationship between the ‘*obligation*’ of trade liberalization and a country’s *trade openness degree*.
- Therefore, this paper suggests: ‘obligation-based market openness,’ **vs.** ‘voluntary-based market openness.’

- 
- The background of the slide features a faint, light blue image of classical architectural columns, possibly from a government building or a university, which adds a sense of formality and academic context to the text.
- TL serves as a powerful indicator of the phenomenon of  $G$ . It is often seen as a prescription to maintain peace or prevent wars after major international conflicts and has become a universal value pursued after the end of the Cold War.
  - However, there is no such thing as a free; as countries pursue integration into trade liberalization, they should evaluate the ‘opportunity cost’ it entails.

**Thank you very much for your attention.  
Sincerely ask everyone to provide me  
with valuable suggestions to make the  
current research more rigorous.**
